

## COVID-19 Use Case: Contact Tracing

This use case is designed to aid health officials with the contact tracing process when someone tests positive for COVID-19. Through SimplyCast's Blueprints and Event tools, officials can document, track, and manage locations identified by patients where they have visited and came into contact with others.

### *How It Works*

A health care official sends a form to a confirmed COVID-19 patient asking who they've been in contact with and where they've visited in the last week. Once submissions are received, the official can map out and manage the locations requiring investigation and send out advisory alerts to people in the area.

### *Why use management technology?*

- Visual representation of data
- Easy data collection
- Contact storage
- Central management dashboard
- Communication capabilities
- Data sharing
