

COVID-19 Use Case: Ventilator Management

This use case is designed to help with the management of the ventilator units available to emergency management staff. Through SimplyCast's Blueprints and Mapping tools, ventilators can be registered, tracked and managed. Information can be shared across multiple accounts in the network so that all stakeholders can see whether a particular unit is not only available, but operational.

How It Works

Each agency registers its ventilator inventory into SimplyCast's Blueprints solution using a standard blueprint template that was created. Once all ventilators are registered, stakeholders can easily view and manage them through the system.

Why use an asset management solution?

- Holistic view of available assets
- Multiple/permission levels
- Visual map display
- Database-driven
